

**IN THE CLAIMS:**

---

Claim 1 (currently amended): A liquid crystal display device comprising a liquid crystal display panel in which a first substrate formed with a signal electrode and a second substrate formed with a single counter electrode on one surface, respectively, are coupled together, with said signal electrode and said counter electrode opposed to each other, with a fixed gap provided therebetween by interposing a sealing part at an outer peripheral part of a display area, and a liquid crystal layer is provided in the gap, wherein

CL  
said signal electrode is composed of a surrounding electrode formed as a single body over almost the entire area of said display area, a pattern electrode isolatedly formed within said surrounding electrode, and a wiring electrode formed across said surrounding electrode with a gap provided between said wiring electrode and said surrounding electrode in order to selectively apply voltage to said pattern electrode,

said counter electrode is provided over the entire area of said display area to face said signal electrode,

said first substrate, said second substrate, said signal electrode and said counter electrode are all transparent,

said liquid crystal layer is a scattering type liquid crystal layer which changes in transmittance and scattering rate depending on existence or absence of application of voltage by means of said signal electrode and said counter electrode, in which transparency increases in a part to which voltage is applied, and

a light source means which emits linearly polarized light is disposed outside a peripheral

part of said liquid crystal display panel, and at least a part of said sealing part facing the light source means has a light transmitting property to allow linearly polarized light emitted from said light source means to pass through said sealing part and enter said liquid crystal layer.

Claim 2 (currently amended): A liquid crystal display device comprising a liquid crystal display panel in which a first substrate formed with a signal electrode and a second substrate formed with a single counter electrode on one surface, respectively, are coupled together, with said signal electrode and said counter electrode opposed to each other, with a fixed gap provided therebetween by interposing a sealing part at an outer peripheral part of a display area, and a liquid crystal layer is provided in the gap, wherein

said signal electrode is composed of a pattern electrode isolatedly formed within said display area, and a wiring electrode formed across said display area in order to selectively apply voltage to said pattern electrode,

said counter electrode is provided in an area to face said pattern electrode, said first substrate, said second substrate, said signal electrode and said counter electrode are all transparent,

said liquid crystal layer is a scattering type liquid crystal layer which changes in transmittance and scattering rate depending on existence or absence of application of voltage by means of said signal electrode and said counter electrode, in which a scattering degree increases in a part to which voltage is applied, and

a light source means which emits linearly polarized light is disposed outside a peripheral

CI  
end  
part of said liquid crystal display panel, and at least a part of said sealing part facing the light source means has a light transmitting property to allow linearly polarized light emitted from said light source means to pass through said sealing part and enter said liquid crystal layer.

---

Claim 3 (previously amended): A liquid crystal display device according to claim 1,  
wherein

CV  
said liquid crystal display panel, in which an outside of said second substrate is a visible side, always presents a condition outside said first substrate to the visible side,

a luminosity of a scattering part, where the transparency does not increase, of said liquid crystal layer becomes higher than luminosities of other parts while a light source part of said light source means is turned on, and

the luminosity of said scattering part of said liquid crystal layer becomes lower than the luminosities of the other parts while said light source part is turned off.

Claim 4 (previously amended): A liquid crystal display device according to claim 2,  
wherein

said liquid crystal display panel, in which an outside of said second substrate is a visible side, always presents a condition outside said first substrate to the visible side,

a luminosity of a scattering part, where the scattering degree is increased, of said liquid crystal layer becomes higher than luminosities of other parts while a light source part of said light source means is turned on, and

the luminosity of said scattering part of said liquid crystal layer becomes lower than the luminosities of the other parts while said light source part is turned off.

Claim 5 (currently amended): A liquid crystal display device according to claim 1,  
wherein

12  
end  
said light source means comprises a light source part and a polarization separating device disposed between the light source part and an outer peripheral part of said liquid crystal display panel.

Claim 6 (previously amended): A liquid crystal display device according to claim 2,  
wherein

said light source means comprises a light source part and a polarization separating device disposed between the light source part and an outer peripheral part of said liquid crystal display panel.

---

Claim 7 (previously amended): A liquid crystal display device according to claim 5,  
wherein

13  
an optical means composed of a convex lens is provided between said light source part of said light source means and said polarization separating device.

Claim 8 (previously amended): A liquid crystal display device according to claim 6,

MB  
encl  
wherein

an optical means composed of a convex lens is provided between said light source part of said light source means and said polarization separating device.

---

Claim 9 (previously amended): A liquid crystal display device according to claim 5,  
wherein

cd  
said scattering type liquid crystal layer of said liquid crystal display panel is a mixed liquid crystal layer composed of transparent solid substances and a liquid crystal, which is produced by applying ultraviolet light to liquid composed of liquid crystal and organic monomers, and

said polarization separating device is disposed so that a transmission axis thereof almost matches with a direction in which a difference between a refractive index of said transparent solid substance and a refractive index of said liquid crystal of said mixed liquid crystal layer is small.

Claim 10 (previously amended) A liquid crystal display device according to claim 6,  
wherein

said scattering type liquid crystal layer of said liquid crystal display panel is a mixed liquid crystal layer composed of transparent solid substances having alignment properties and a liquid crystal, which is produced by applying ultraviolet light to liquid made by mixing liquid crystal polymers into liquid crystal and organic monomers, and

cd  
end  
said polarization separating device is disposed so that a transmission axis thereof almost matches with a direction in which a difference between a refractive index of said transparent solid substance and a refractive index of said liquid crystal of said mixed liquid crystal layer is small.

---

Claim 11 (original): A liquid crystal display device according to claim 9, wherein said polarization separating device is an absorption type polarizer having a transmission axis and an absorption axis substantially perpendicular to the transmission axis.

cs  
Claim 12 (original): A liquid crystal display device according to claim 10, wherein said polarization separating device is an absorption type polarizer having a transmission axis and an absorption axis substantially perpendicular to the transmission axis.

Claim 13 (original): A liquid crystal display device according to claim 9, wherein said polarization separating device is a reflection type polarizer having a transmission axis and a reflection axis substantially perpendicular to the transmission axis.

Claim 14 (original): A liquid crystal display device according to claim 10, wherein said polarization separating device is a reflection type polarizer having a transmission axis and a reflection axis substantially perpendicular to the transmission axis.

Claim 15 (original): A liquid crystal display device according to claim 13, wherein a diffuser is provided between said polarization separating device and said light source part, and a reflector is provided around said light source part.

CSX  
Cm  
Claim 16 (original): A liquid crystal display device according to claim 14, wherein a diffuser is provided between said polarization separating device and said light source part, and a reflector is provided around said light source part.

Claim 17 (original): A liquid crystal display device according to claim 9, wherein said polarization separating device is composed of an absorption type polarizer having a transmission axis and an absorption axis substantially perpendicular to the transmission axis, and a reflection type polarizer having a transmission axis and a reflection axis substantially perpendicular to the transmission axis, and said absorption type polarizer is disposed on said liquid crystal display panel side and said reflection type polarizer is disposed on said light source part side respectively with directions of the respective transmission axes of said absorption type polarizer and said reflection type polarizer matching with each other.

Claim 18 (original): A liquid crystal display device according to claim 10, wherein said polarization separating device is composed of an absorption type polarizer having a transmission axis and an absorption axis substantially perpendicular to the transmission axis, and a reflection type polarizer having a transmission axis and a reflection axis substantially

perpendicular to the transmission axis, and said absorption type polarizer is disposed on said liquid crystal display panel side and said reflection type polarizer is disposed on said light source part side respectively with directions of the respective transmission axes of said absorption type polarizer and said reflection type polarizer matching with each other.

---

Claim 19 (previously amended): A liquid crystal display device according to claim 5, wherein

light intensity change means which controls increase and decrease of an intensity of light to make incident on said liquid crystal display panel in accordance with an intensity of light incident on said liquid crystal display panel from outside said first substrate is provided in said light source means.

Claim 20 (previously amended): A liquid crystal display device according to claim 6, wherein

light intensity change means which controls increase and decrease of an intensity of light to make incident on said liquid crystal display panel in accordance with an intensity of light incident on said liquid crystal display panel from outside said first substrate is provided in said light source means.

Claim 21 (previously amended): A liquid crystal display device according to claim 19, wherein

CB  
enc

said light intensity change means comprises a liquid crystal cell provided between said polarization separating device and the light source part, a polarizer arranged on a light source part side of the liquid crystal cell, an exposure meter for detecting the intensity of the light incident from outside said first substrate, and a liquid crystal driving circuit for changing voltage applied to said liquid crystal cell in accordance with an output from said exposure meter.

Claim 22 (previously amended): A liquid crystal display device according to claim 20, wherein

said light intensity change means comprises a liquid crystal cell provided between said polarization separating device and the light source part, a polarizer arranged on a light source part side of the liquid crystal cell, an exposure meter for detecting the intensity of the light incident from outside said first substrate, and a liquid crystal driving circuit for changing voltage applied to said liquid crystal cell in accordance with an output from said exposure meter.

C7

Claim 23 (original): A liquid crystal display device according to claim 9, wherein an ultraviolet cutting layer is provided at least on one of outer surfaces of said first and second substrates of said liquid crystal display panel.

Claim 24 (original): A liquid crystal display device according to claim 10, wherein an ultraviolet cutting layer is provided at least on one of outer surfaces of said first and second substrates of said liquid crystal display panel.

Claim 25 (original): A liquid crystal display device according to claim 9, wherein an anti-reflection layer for preventing reflection of light within a wavelength range of light emitted by said light source part is provided at least on one of outer surfaces of said first and second substrates of said liquid crystal display panel.

Claim 26 (original): A liquid crystal display device according to claim 10, wherein an anti-reflection layer for preventing reflection of light within a wavelength range of light emitted by said light source part is provided at least on one of outer surfaces of said first and second substrates of said liquid crystal display panel.

Claim 27 (original): A liquid crystal display device according to claim 9, wherein said liquid crystal display device is a module to be installed in a finder optical system of a camera, and said pattern electrode of said liquid crystal display panel is an electrode for displaying an autofocus target pattern.

Claim 28 (original): A liquid crystal display device according to claim 10, wherein said liquid crystal display device is a module to be installed in a finder optical system of a camera, and said pattern electrode of said liquid crystal display panel is an electrode for displaying an autofocus target pattern.

Claim 29 (original): A liquid crystal display device according to claim 27, wherein

C1  
frd  
a finder screen is disposed outside said first substrate and a finder lens is disposed outside said second substrate of said liquid crystal display panel respectively.

Claim 30 (original): A liquid crystal display device according to claim 28, wherein a finder screen is disposed outside said first substrate and a finder lens is disposed outside said second substrate of said liquid crystal display panel respectively.

---

C8  
Claim 31 (previously added): A liquid crystal display device according to claim 5, wherein said light source part can selectively emit lights in different optical wavelength regions.

Claim 32 (previously added): A liquid crystal display device according to claim 6, wherein said light source part can selectively emit lights in different optical wavelength regions.

Claim 33 (previously added): A liquid crystal display device according to claim 5, wherein said light source part can be selectively turned on in accordance with brightness of environments or strength of incoming light, and period in which said light source part is turned on can be selected.

CS  
end  
Claim 34 (previously added): A liquid crystal display device according to claim 6,

wherein

said light source part can be selectively turned on in accordance with brightness of environments or strength of incoming light, and period in which said light source part is turned on can be selected.

---

pa  
Claim 35 (previously added): A liquid crystal display device according to claim 1,

wherein said liquid crystal display device is a module comprising a panel holding frame and a panel fixing frame, installed in a finder optical system of a camera, and a gap between said panel holding frame, said panel fixing frame, and said liquid crystal display panel installed in said frames is filled with a heat insulating seal.

Claim 36 (previously added): A liquid crystal display device according to claim 2,

wherein said liquid crystal display device is a module comprising a panel holding frame and a panel fixing frame, installed in a finder optical system of a camera, and a gap between said panel holding frame, said panel fixing frame, and said liquid crystal display panel installed in said frames is filled with a heat insulating seal.
